VS2	09/11/18	Updated Section 8.1 (Input Bandwidth)

CONTENTS

1. INTRODUCTION

This scaler has DisplayPort, HDMI and PC (VGA) inputs which can be freely selected for output at a scaled resolution of the user's choosing over the mirrored HDMI and HDBaseT outputs. This unit also includes separate analog and digital audio outputs to provide additional playback flexibility. Support for HDMI output resolutions up to 1080p/WUXGA (RB) and Analog to Digital Conversion (ADC) functionality combine to allow for a wide range of AV signals to be displayed on the connected HDMI displays.

Beyond video switching and scaling, this unit also features useful audio functions. The Optical Audio Return (OAR) feature supports transmitting optical audio from a compatible HDBaseT Receiver to this unit for local playback. An integrated audio DSP with gain control for routing audio and controlling background audio levels adds to the versatility of this product. The HDBaseT output can provide 48V PoH to power to compatible HDBaseT Receivers. The unit can be controlled via front panel buttons with an On-Screen Display (OSD), WebGUI, IR remote, Telnet, and RS-232 making it exceptionally versatile.

1) **Video Routing:** Selects the input source to display.

2) **Output:** Selects the output resolution to use. Selecting Native-Cat.5e/6 or Native-HDMI will make the unit automatically select an output resolution based on the detected EDID of the connected display.

3) **Aspect:** Selects the aspect ratio to use when outputting the source. "Full" stretches the source to fill the output resolution, regardless of the original aspect ratio, while "Best Fit" will always attempt to retain the original source's correct aspect ratio by adding black bars if necessary. "Follow In" centers the source on the screen, without any scaling (1:1 pixel reproduction).

4) **DP HDCP:** Selects the HDCP logic to use with the DisplayPort input. Setting this to "Off" will completely disable HDCP support on that input.

5) **HDMI1 HDCP:** Selects the HDCP logic to use with HDMI input 1. Setting this to "Off" will completely disable HDCP support on that input.

6) **HDMI2 HDCP:** Selects the HDCP logic to use with HDMI input 2. Setting this to "Off" will completely disable HDCP support on that input.

7) **No Signal Color:** Selects the free run color to use when no live input source is detected.

8) **Blank:** Allows for the output video and audio to be blanked/ muted.

9) **Freeze:** Allows for the output video to be frozen. While the output is frozen, audio output will also be muted.

10) **Auto Setup [submenu]**

   Auto Sync Off: Sets the amount of time to continue outputting sync with the free run color if there is no live source and no operations have been executed on the unit. Setting this to "OFF" forces the unit to always output sync.

   Auto Scan: Enable or disable the auto scan on source loss feature. Selecting a specific input will force the search to begin with that input.

   Auto Switch: Enable or disable automatically switching to any newly detected source.

11) **VGA Setup:** These settings control the input specifications to use with the VGA inputs. Activating the Auto Setup function forces the unit to attempt to detect the correct values. Selecting reset will reset all VGA input settings.

   Note: The "Auto Setup" function requires a VGA source with a bright, edge-to-edge, image to accurately judge the dimensions of the signal.

6.6.1 Main Page 0

All primary functions of this unit are controllable via the built-in WebGUI. This control is presented across 2 separate tabs (MainPage0 and MainPage1). After logging in, the browser will display the unit's primary control tab (MainPage0) to allow direct control of the unit. If desired, the numerical value for many of the items can be entered directly by typing it in the box above the slider bar. Press "Enter" to accept the newly entered value.

- **STATUS**

This section provides information about the unit's current input, output and HDCP status as well as the current Firmware Revision.

- **VIDEO**

This section allows for control of input selection, output resolution & aspect ratio, HDCP behavior for the HDMI & DisplayPort inputs, the "no signal" color, blanking or freezing the output, as well as configuring the auto switch and sync functionality of the unit.

- **COLOR**

This section provides detailed controls for the output R/G/B levels, contrast, saturation, brightness, hue, and sharpness as well as controlling noise reduction. To return these settings to their defaults, click on the "Reset Picture" EXE button.

- **VGA**

This section allows for direct control of the H-position, V-position, phase, and clock used by the current VGA input. These settings can be automatically configured by clicking on the "Auto Setup" EXE button. To return these settings to their defaults, click on the "Reset" EXE button.

Note: The VGA section is only active when a live VGA source is currently selected. These settings are shared by both VGA inputs.

- **EDID**

This section allows the user to choose the EDID to be used with each input. It is also possible to upload custom user EDIDs here. User EDIDs 1-3 are only usable by the HDMI and DisplayPort inputs. User EDIDs 4-5 are only usable by the VGA inputs.

6.6.2 Main Page 1

Select the "MainPage1" tab to adjust settings related to audio output, the OSD, Ethernet, and power. System reset, authentication changes and firmware updates may also be performed from here. If desired, the numerical value for many of the items can be entered directly by typing it in the box above the slider bar. Press "Enter" to accept the newly entered value.
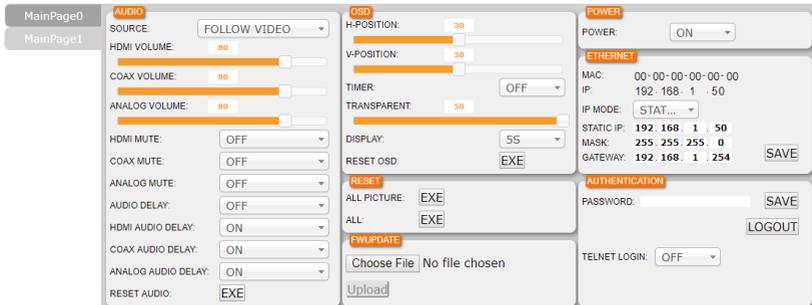

- **AUDIO**

This section provides controls to set each individual audio output type's volume levels, and delay settings. Each output type may also be muted independently. When the Audio Source is set to "Follow Video" the analog audio inputs are mapped as follows: Audio 1 > Digital video (DisplayPort, HDMI 1 and HDMI 2), Audio 2 > VGA 1, Audio 3 > VGA 2.

Note: All audio output types share the same unified delay value when audio delay is enabled.

- **OSD**

This section lets the user change the H/V positioning of the OSD, the display timeout timer, and OSD window transparency. The information OSD's behavior is also controlled here with a choice between ON, OFF, 5 seconds and 10 seconds.

- **RESET**

This section allows for resetting only the output picture settings, or returning the entire unit to its factory defaults.

- **POWER**

This section allows for the unit to be powered ON or placed into stand-by mode (OFF).

- **ETHERNET**

This section allows for setting the unit to either Static or DHCP mode for obtaining its IP information. When DHCP mode is selected, the unit will attempt to obtain an automatically assigned IP address from the local DHCP server. When in Static mode, the IP, Netmask and Gateway must be set manually. After making any changes to this section, please click the "SAVE" button.

Note: If the IP address is changed then the IP address required for WebGUI or Telnet access will also change accordingly. Consult the OSD to view the current IP settings if necessary.

- **FWUPDATE**

This section allows for new firmware to be uploaded into the unit. To update the unit's firmware click the "Choose File" button to open the file selection window and then select an appropriate firmware update file (*.bin format) located on your local PC. After selecting the file, click the "Upload" button to begin the firmware update process. Once the firmware update process has completed the unit will reboot.

- **AUTHENTICATION**

This section allows for the admin login password to be changed. The default password is "admin". Requiring a login to access Telnet may also be enabled or disabled here.
